

isAdmin Error Fix Report

Issue

The deployed website was showing 'ReferenceError: isAdmin is not defined' on the Q&A page, indicating improper usage of the admin context.

Root Cause

In `QAQuestionPage.tsx`, the component was attempting to manually handle the admin context with error handling, creating a direct `isAdmin` variable instead of properly using the `useAdmin()` hook.

Fix Applied

File: `/src/pages/QAQuestionPage.tsx`

Before:

```
// Safely get admin context with error handling
let adminContext
let isAdmin = false

try {
  adminContext = useAdmin()
  isAdmin = adminContext?.isAdmin || false
} catch (error) {
  console.warn('Failed to load admin context:', error)
  isAdmin = false
}
```

After:

```
const { isAdmin } = useAdmin()
```

Verification

-  Searched entire codebase for improper `isAdmin` usage
-  Confirmed all components properly use `const { isAdmin } = useAdmin()` pattern
-  Build completed successfully without errors
-  Application ready for redeployment

Impact

- Eliminates the `ReferenceError: isAdmin is not defined` error
- Ensures consistent admin context usage across the application
- Maintains proper React hook usage patterns

Files Modified

1. `/src/pages/QAQuestionPage.tsx` - Fixed direct `isAdmin` variable declaration

Build Status

 **SUCCESS** - Application builds without errors and is ready for deployment.
